

(TR-104) PYTHON WITH AI/ML

Training Day 16 Report

Date: 2 February 2026

Topic Covered: Asynchronous Programming in Python

The sixteenth day of training focused on understanding asynchronous programming concepts in Python, including non-blocking execution and concurrent task handling using asyncio.

- Understood the difference between blocking and non-blocking execution.
- Learned why asynchronous programming is important for performance optimization.
- Studied the use of `async` and `await` keywords in Python.
- Explored the event loop and its working mechanism.
- Practiced `asyncio.run()` for executing asynchronous programs.
- Compared `gather()` and `create_task()` for handling multiple concurrent tasks.
- Performed `async sleep` simulation and `async file reading` exercises.
- Built an asynchronous script to fetch data from 5 APIs concurrently and log response times.
