

(TR-104) PYTHON WITH AI/ML

Training Day 2 Report:

Date: 13 January 2026

Topic Covered: Git & GitHub

The second day of training focused on understanding Git and GitHub and their importance in version control and collaborative development.

- Git was introduced as a distributed version control system used for managing code versions.
- The importance of Git for tracking changes, collaboration, and reverting to previous versions was explained.
- Git configuration using username and email was demonstrated.
- Common Git commands such as git init, git status, git add, git commit, and git log were covered during the session.
- Remote repository setup and usage were explained using commands like git remote add, git push, and git pull.
- Git workflow was explained as a step-by-step process for managing code changes from the local repository to the remote repository.
- Changes are first made in the working directory and then moved to the staging area using git add.
- After that, git commit is used to save changes to the local repository with a meaningful message.
- Finally, git push is used to upload commits to the remote repository.
- The difference between Git and GitHub was also clarified. Git is a version control software used to track code changes locally, while GitHub is an online platform used to store and manage repositories remotely and collaborate with others.

Overall, the session helped in understanding version control, repository management, and basic Git workflow.
