

(TR-104) PYTHON WITH AI/ML

Training Day 8 Report

Date: 21 January 2026

Topic Covered: Python Functions & File Handling

The eighth day of training focused on practicing Python functions, argument handling, nested functions, and file handling concepts through hands-on programming tasks.

- Implemented functions for temperature conversion, rectangle area calculation, string reversal, and tip calculation using parameters and return statements.
- Practiced the use of positional arguments, keyword arguments, and default arguments in Python functions.
- Worked on list modification, string formatting, and greeting generation using custom functions.
- Learned concepts related to local variables, global constants, nested functions, and the use of nonlocal variables.
- Implemented programs for calculating trapezoid area, square area, combined area calculations, and error handling for invalid inputs.
- Practiced built-in Python functions such as len(), max(), min(), reversed(), float(), and str().
- Learned different file handling modes in Python including read, write, append, exclusive creation, binary, text, and update modes.
- Practiced opening, reading, writing, appending, and closing files using open() and with statements.
- Implemented file handling programs such as File Reader, File Writer, File Appender, Log File Creator, Word Count, Specific Line Retrieval, and Chunked File Processing.
- Completed programs for writing user input, appending names, and storing numbers in files using Python file operations.

- Improved understanding of Python functions, modular programming, and file management concepts through practical implementation.

Overall, the session helped in strengthening understanding of Python functions, argument handling, file operations, and practical problem-solving skills.
