

(TR-104) PYTHON WITH AI/ML

Training Day 60 Report

Date: 3 April 2026

Topic Covered: Instagram MCP Research, API Evaluation & AI Flow Builder Prototype

The sixtieth day of training focused on evaluating Instagram data access methods, exploring official API-based alternatives, and building a prototype AI workflow system using Streamlit. The session also included analysis of Instagram Graph API requirements and development of a basic flow-based AI pipeline.

- Investigated Instagram MCP server availability and confirmed that no official MCP server exists for Instagram.
- Explored alternative approach using Instagram Graph API for structured data access.
- Studied requirements for Graph API including Instagram Business/Creator account and Facebook Page linking.
- Learned the process of generating access tokens through Meta for Developers platform.
- Analyzed limitations of direct scraping compared to official API-based access methods.
- Explored RapidAPI options for Instagram-related data extraction and integration.
- Tested contact and enquiry forms and verified successful submissions with proper validation behavior.
- Confirmed that previously identified form issues were resolved and system is stable.
- Built an AI Flow Builder prototype using Streamlit for workflow-based AI processing.
- Designed pipeline structure including Input, RAG, MCP, Agent, Ollama, and Output nodes.
- Implemented conditional workflow logic for routing between RAG and MCP processing paths.
- Integrated MCP tool handling for basic operations like time, date, and math functions.

- Connected Ollama model for contextual response generation within workflow system.
- Tested visual workflow execution using streamlit-flow library.
- Strengthened understanding of API-based integrations, workflow orchestration, and modern AI system design.
