

(TR-104) PYTHON WITH AI/ML

Training Day 78 Report

Date: 29 April 2026

Topic Covered: Tool Architecture Review, Agent Prompt Optimization, Query Validation & WebSocket Learning

The seventy-eighth day of training focused on reviewing the complete tool architecture, improving AI agent prompts, validating query behavior, analyzing payment workflows, and learning real-time communication concepts.

- Reviewed all implemented tools across Payment, Trailer, Customer, and Insurance modules.
- Analyzed tool functionality, workflow integration, and query-to-tool mapping mechanisms.
- Refined system prompts to improve response consistency, formatting standards, and tool usage accuracy.
- Added support for field-specific queries and strengthened prompt rules for data-driven responses.
- Conducted extensive testing of payment, trailer, customer, and insurance-related queries.
- Validated response formats, tool selection behavior, and query intent handling across multiple scenarios.
- Analyzed payment status workflows including paid, pending, and overdue classifications.
- Verified due-date handling logic and payment status management across the system.
- Learned WebSocket communication concepts and compared WebSockets with traditional HTTP request-response architecture.
- Tested Ollama integration through Ngrok and validated LangChain communication with remote LLM services.
- Downloaded and verified the EJP Furniture logo for project-related requirements.
- Revised concepts related to tool-based AI systems, prompt engineering, payment workflows, WebSockets, and LLM integration.

Overall, the training enhanced understanding of AI tool architecture, prompt engineering, query validation, payment management systems, and real-time communication technologies.
