

(TR-104) PYTHON WITH AI/ML

Training Day 83 Report

Date: 6 May 2026

Topic Covered: Database Testing, Project Analysis, Schema Validation & Requirement Review

The eighty-third day of training focused on testing the AI system using sample and production databases, analyzing real-world projects, reviewing business requirements, and validating database schemas for consistency and accuracy.

- Tested the system using a sample database and executed multiple natural language queries to validate functionality.
- Verified data retrieval accuracy, response formatting, and overall system behavior.
- Reviewed and analyzed brochure content to identify formatting issues, inconsistencies, duplicate entries, and content improvements.
- Suggested enhancements including FAQs, table of contents, testimonials, batch details, and presentation improvements.
- Created a structured FAQ section to address common student queries.
- Analyzed the IRIS AI Assistant project, including its objectives, workflow, tool integrations, and business use cases.
- Studied how AI-powered systems interact with business data through natural language interfaces.
- Explored the AEKO Australia platform and analyzed its objectives, business requirements, and system functionality.
- Evaluated the DAV Transport Booking Platform to understand its workflow, booking process, and problem-solving approach.
- Connected to the production MongoDB database and explored the actual database structure and collections.
- Compared frontend requirements with the database schema and identified field mismatches requiring updates.
- Analyzed missing or incomplete data across key collections such as lease payments and insurance records.

- Reviewed poster content and verified spelling, grammar, and overall presentation quality.
- Revised concepts related to database testing, schema validation, project requirement analysis, business workflow understanding, and production database exploration.

Overall, the training enhanced understanding of database validation, schema analysis, project requirement gathering, real-world application workflows, and AI system testing methodologies.
