

(TR-104) PYTHON WITH AI/ML

Training Day 91 Report

Date: 18 May 2026

Topic Covered: Image Recognition Research, Computer Vision Libraries & AI Techniques Exploration

The ninety-first day of training focused on researching image recognition technologies, exploring computer vision libraries, and studying techniques used for image analysis and recognition systems.

- Researched image recognition concepts and their applications in AI-powered systems.
- Explored computer vision libraries including OpenCV, Dlib, and face_recognition.
- Studied facial recognition workflows, face detection techniques, and image preprocessing methods.
- Reviewed feature extraction techniques used in image classification and recognition systems.
- Analyzed image embedding generation and similarity comparison approaches.
- Explored object detection and image classification methodologies.
- Reviewed practical use cases of computer vision in attendance systems, security applications, and automation solutions.
- Compared different image recognition approaches based on performance, accuracy, and implementation complexity.
- Studied integration possibilities of image recognition modules within AI-based applications.
- Revised concepts related to computer vision, image processing, face recognition, feature extraction, and AI-based image analysis.

Overall, the training enhanced understanding of image recognition systems, computer vision libraries, image processing workflows, and practical AI applications.
